Setup:
Goal of the game: be the first player to get rid of all the cards in your hand

Players: 2 to 10 players – maybe I can limit it to two people?

Piles: 2 piles – Put the leftover cards face down as the **Draw Pile**. Flip the top card face up to start the **Discard Pile**.

- Use random.shuffle() to randomize the deck and deal hands

Playing the game:
Matching: On your turn, play a card that matches the top card on the discard pile by color, number, or symbol (or all).

Drawing: If you do not have a matching card, draw one card from the draw pile. If you can play it, you may play it right away. Otherwise, your turn ends.

Saying "Uno": You need to yell "UNO!" when you have only one card left. — I can just make an assumption and assume that a person will always say UNO when they have one card left.

Cards (https://www.letsplayuno.com/news/guide/20181213/30092_732567.html):

- 108 cards in a deck
- 76 number cards
- 24 action cards
- 8 wild cards
- **Four "suits":** red, yellow, blue, green

- Each color contains 19 cards: one number 0 card and two sets of cards numbered 1-9
- **Action cards:** there are two of each action card in each color – draw 2, reverse, skip
- **Wild cards:** change color and draw four. There are 4 of each kind of wild card.

- How I will do the logic of the game: given the cards I have in my hand, and I know the cards that have already been played, and I know the makeup of the game and what/how many cards are in a deck, how can I plan my next optimal move even though I don't exactly know what cards are in my opponents hand (although I guess I can calculate that with all the information I have – maybe I can have a probability thing of what the next card they will play is, and then based off that it can tell me what my next optimal move is?).
